

SeeL 2017/18

Programming Group – Meeting Week: 4

Topics and Decisions:

- ➔ **Archive:** We are going to design the archive. Not the analytics group. Ask analytics group if the archives stores older versions of articles or just the change logs?
- ➔ Idea: Everytime the crawler runs the crawled content will be compared with current used files. If changes exist the old text will be stored into the archive. Else the current file will not be changed.
- ➔ Ask where the hell did they get their Excel-Relation-Table. Problem: We cannot update the BSI on the platform if the relations change and the excel-file does not update the relations.
- ➔ Who the hell came up with the voting idea? Where is the gain in it?
- ➔ Creating time table until January (?)
- ➔ Do we need and want a REST API?
